SECTION 1 PRECAUTION

This service manual does not describe PRECAUTION.

SECTION 2 SPECIFIC SERVICE INSTRUCTIONS

2.1 Circuit Description

2.1.1 Outline

The TH-D74A is an FM triple-band handheld transceiver designed for amateur radio applications in the 144/220/430 MHz bands.

2.1.2 Frequency Configuration

This transceiver has two discrete VCO/PLL and IF circuit configurations for the A-band and B-band to achieve simultaneous dual-band signal reception and full-duplex operation.

The VCO block of the A-band is used as the first local oscillator for VHF and UHF reception in the A-band. The VCO block for the B-band is composed of two VCOs including modulation circuitry and used as the first local oscillator for the VHF/220 MHz/UHF transmission of signals and reception of signals in a range of 0.1 to 524 MHz in the B-band.

The 19.200 MHz reference oscillator connected to the PLL IC for the A-band is used to generate a PLL comparison frequency. The reference oscillator that generates a frequency of 57.600 MHz tripled from the 19.200 MHz is used for the comparison frequency of the PLL IC for the B-band. Furthermore, this reference oscillator is used as the second local oscillator for the reception of signals in both A-band and B-band.

Fig.1 Frequency configuration

Table 1 Frequency configuration

TH-D74A (K-type)	
A	144.000 ~ 147.995MHz 222.000 ~ 224.995MHz 430.000 ~ 449.995MHz
B	0.100 ~ 75.995MHz 108.000 ~ 523.995MHz
C	136.000 ~ 173.995MHz 216.000 ~ 259.995MHz 410.000 ~ 469.995MHz
D	58.150 ~ 468.045MHz
E	158.850 ~ 412.845MHz

2.1.3 Receiver System

2.1.3.1 VHF/220MHz receiver circuit

■A band VHF/220MHz receiver circuit

The reception signal from the antenna passes through the filter circuit and enters the RF amplifier (Q179). The signal amplified by the RF amplifier (Q179) enters the distribution circuit for signal distribution with the B-band. The distributed signal is amplified by the second RF amplifier (Q178), passes through the band-pass filter, and enters the mixer (Q281). The signal is converted to a first IF of 57.150 MHz after the signal undergoes upper heterodyne conversion by the first local oscillation frequency. Then the signal is amplified by the IF amplifier (Q282) after the signal passes through the MCF (XF281), and applied to the IF IC (IC281).

The signal undergoes upper heterodyne conversion in the IF IC (IC281) by the second local oscillation frequency (57.600 MHz) tripled from the reference frequency (19.200 MHz). Then the signal is converted to a second IF of 450 kHz and detected to generate an audio signal.

■B band VHF/220MHz receiver circuit

The reception signal from the antenna passes through the filter circuit and enters the RF amplifier (Q179). The signal amplified by the RF amplifier (Q179) enters the distribution circuit for signal distribution with the A-band. The distributed signal is amplified by the second RF amplifier (Q193), passes through the band-pass filter, and enters the mixer (IC283). The signal is converted to a first IF of 58.050 MHz after the signal undergoes upper heterodyne conversion by the first local oscillation frequency. Then the signal is applied to the IF IC (IC284) through the MCF (XF282).

The signal undergoes lower heterodyne conversion in the IF IC (IC284) by the second local oscillation frequency (57.600 MHz) tripled from the reference frequency (19.200 MHz). Then the signal is converted to a second IF of 450 kHz and detected to generate an audio signal. While the transceiver is in AM/SSB/CW mode, the signal is converted to a third IF of 10.8 kHz after the signal undergoes upper heterodyne conversion by the 3rd local oscillation frequency (460.8 kHz). Then the signal is input into the CODEC IC (IC707).

■VHF/220MHz accompanying circuit

Tuning voltage output from the D/A converter (IC671) under the control of the main MPU (IC702) is applied to each band-pass filter through a discrete variable-capacitance diode so that the respective band-pass filters will be tuned to target frequencies.

Fig.2 VHF/220MHz receiver circuit

2.1.3.2 UHF receiver circuit

■A band UHF receiver circuit

The reception signal from the antenna passes through the filter circuit and enters the RF amplifier (Q172). The signal amplified by the RF amplifier (Q172) enters the distribution circuit for signal distribution with the B-band. The distributed signal is amplified by the second RF amplifier (Q171), passes through the bandpass filter, and enters the mixer (Q281). The signal is converted to a first IF of 57.150 MHz after the signal undergoes lower heterodyne conversion by the first local oscillation frequency. Then the signal is amplified by the IF amplifier (Q282) after the signal passes through the MCF (XF281), and applied to the IF IC (IC281).

The signal undergoes upper heterodyne conversion in the IF IC (IC281) by the second local oscillation frequency (57.600 MHz) tripled from the reference frequency (19.200 MHz). Then the signal is converted to a second IF of 450 kHz and detected to generate an audio signal.

■B band UHF receiver circuit

The reception signal from the antenna passes through the filter circuit and enters the RF amplifier (Q172). The signal amplified by the RF amplifier (Q172) enters the distribution circuit for signal distribution with the A-band. The distributed signal is amplified by the second RF amplifier (Q192), passes through the band-pass filter, and enters the mixer (IC283). The signal is converted to a first IF of 58.050 MHz after the signal undergoes upper heterodyne conversion by the first local oscillation frequency. Then the signal is input into IF IC (IC284) through the MCF (XF282). The signal undergoes lower heterodyne conversion in the IF IC (IC284) by the second local oscillation frequency (57.600 MHz) tripled from the reference frequency (19.200 MHz). Then the signal is converted to a second IF of 450 kHz and detected to generate an audio signal.

While the transceiver is in AM/SSB/CW mode, the signal is converted to a third IF of 10.8 kHz after the signal undergoes upper heterodyne conversion by the 3rd local oscillation frequency (460.8 kHz). Then the signal is input into the CODEC IC (IC707).

■UHF accompanying circuit

Tuning voltage output from the D/A converter (IC671) under the control of the main MPU (IC702) is applied to each band-pass filter through a discrete variable-capacitance diode so that the respective band-pass filters will be tuned to target frequencies.

Fig.3 UHF receiver circuit

2.1.3.3 HF receiver circuit

■HF receiver circuit

The reception signal from the antenna passes through the filter circuit and enters the RF amplifier (Q190). The signal amplified by the RF amplifier (Q190) enters the mixer (IC283) after the signal is further amplified by the second amplifier (Q191). The signal is converted to a first IF of 58.050 MHz after the signal undergoes upper heterodyne conversion by the first local oscillation frequency. Then the signal is applied to the IF IC (IC284) through the MCF (XF282). The signal undergoes lower heterodyne conversion in the IF IC (IC284) by the second local oscillation frequency (57.600 MHz) tripled from the reference frequency (19.200 MHz). Then the signal is converted to a second IF of 450 kHz and detected to generate an audio signal.

While the transceiver is in AM/SSB/CW mode, the signal is converted to a third IF of 10.8 kHz after the signal undergoes upper heterodyne conversion by the 3rd local oscillation frequency (460.8 kHz). Then the signal is input into the CODEC IC (IC707).

■BAR Antenna circuit

The bar antenna can be selected for HF reception.

The reception signal from the bar antenna passes through the tuning circuit and enters the RF amplifier (Q190). Then the signal is received on the same path in the HF receiving circuit.

Fig.4 HF receiver circuit

2.1.3.4 FM Tuner receiver circuit

■FM Tuner receiver circuit

The reception signal from the antenna passes through the filter circuit and enters the RF amplifier (Q195). The signal amplified by the RF amplifier is further amplified by the second RF amplifier (Q675) after the signal passes through the filter circuit, and enters the FM Tuner IC (IC674). The RF signal is demodulated in the FM tuner IC (IC674) and converted into an audio signal.

Fig.5 FM Tuner receiver circuit

2.1.4 Transmitter System

2.1.4.1 Transmitter circuit

The VCO (B-band) VHF transmission signal that is sent from the RF amplifier (Q361) passes through the band switches (D35 and D32). The pre-drive amplifier (IC1) and drive amplifier (Q6) amplify the signal. The signal passes through the band switches (D22 and D26), and the final amplifier (Q2) amplifies the signal to the final output level. Then the signal passes through the antenna switches (D13, D14, and D45), triplexer, and LPF, and is fed to the antenna.

The VCO (B-band) UHF transmission signal that is sent from the RF amplifier (Q361) passes through the band switches (D36 and D33). The pre-drive amplifier (IC1) and drive amplifier (Q6) amplify the signal. The signal passes through the band switch (D31), and the final amplifier (Q2) amplifies the signal to the final output level. Then the signal passes through the antenna switches (D42, D43, D18, and D19), triplexer, and LPF, and is fed to the antenna.

The VCO (B-band) 220 MHz band transmission signal that is sent from the RF amplifier (Q361) passes through the band switches (D37 and D34). The pre-drive amplifier (IC1) and drive amplifier (Q6) amplify the signal. The signal passes through the band switch (D23), and the final amplifier (Q1) amplifies the signal to the final output level. Then the signal passes through the antenna switches (D15 and D16), triplexer, and LPF, and is fed to the antenna.

2.1.4.2 APC circuit

The automatic power control (APC) circuit ensures stable TX power and is in control of TX power by detecting voltage generation from the drain current of the final amplifier (Q1 or Q2) in use.

The operational amplifier circuit (consisting of IC3 and Q12) amplifies the voltage on R55 and R57 generated by the drain current of the final amplifier, and the generated voltage (CURR) is input into the main MPU (IC702) through the A/D converter (IC725).

The main MPU (IC702) compares the transmission CURR voltage and adjustment CURR voltage and changes the APC voltage according to the comparison result. The main MPU (IC702) inputs the APC voltage into the gates of the drive amplifier (Q6) and the final amplifier (Q1 or Q2) through the D/A converter (IC671) and operational amplifier (IC287), thus changing the TX power level. In the power adjustment menu, power adjustments are made by changing the APC voltage (APC digit) value. The APC loop function is OFF in the power adjustment menu. When an appropriate APC voltage level is determined, the APC voltage and CURR voltage will be stored as adjustment values. The adjustment values are used for APC performance while the transceiver is in user mode.

2.1.4.3 Thermal protection circuit

The sub MPU (IC661) monitors the detected voltage (FTH) of the thermistor (TH1) arranged for the prevention of the thermal breakdown of the final amplifier (Q1 or Q2) in use. An APC voltage (OAGCA/APC) change will occur when the temperature exceeds the preset temperature, at which time the TX power will be controlled to prevent excessive heat generation.

Fig.6 Transmitter circuit

2.1.5 VCO-PLL Circuit

2.1.5.1 Oscillator circuit

A standard reference frequency of 19.2 MHz is generated from the TCXO (X362) of the reference oscillation circuit is divided in the PLL IC (IC364) to provide a comparison frequency of 800 kHz. The reference frequency tripled to 57.600 MHz in the RF amplifier block (Q382 and Q378) is divided in the PLL IC (IC284) to provide a comparison frequency of 480 kHz.

Furthermore, a reference frequency of 57.600 MHz is used as the second local oscillation frequency of both A-band and B-band. The A-band VCO signal is generated and amplified by the oscillation amplifier (Q386) and sent to the F-in amplifier (Q384) and F-out amplifier (Q381) through the buffer amplifier (Q383). The B-band VCO signal is generated and amplified by the two oscillation amplifiers (Q368 and Q369) and sent to the F-in amplifier (Q364) and F-out amplifier (Q365) through the buffer amplifier (Q389). The signal will be branched directly to the transmission side and the reception side if the signal is not divided after the signal passes through the F-out amplifier. If the signal is split, the signal will be branched to the transmission side and reception side through the frequency divider (IC361) and amplifier (Q363). The signal on the reception side is provided to the mixer (IC283). The signal on the transmission side is provided to the pre-drive (IC1) after the signal passes through the amplifier (Q361). The reference oscillator modulates the signal at the time of transmission.

2.1.5.2 Phase comparator

These PLL ICs of fractional-N type divide the input oscillation frequency and reference frequency according to PLL data from the sub MPU (IC661) and make phase comparison to achieve the PLL synthesizer according to the desired step frequency.

2.1.5.3 Lock voltage

Pulse signals obtained by phase comparison in the respective PLL ICs (IC284 and IC364) are swept output from the built-in charge pumps and used as the control voltages of the respective VCOs for oscillation frequency control after the loop filters eliminate the ripples in the signals.

2.1.5.4 Unlock detection circuit

The LD pins (pin 39 of the IC284 and pin 7 of the IC364) of the PLL ICs will output L-level signals when the PLLs are unlocked. The main MPU (IC702) is in control of the switching timing of transmission and reception by monitoring the output.

Fig.7 VCO-PLL circuit

2.1.6 Power Supply Circuit

2.1.6.1 DC-IN circuit

The +B power supply will be provided with a constant voltage of 8.3 V through the charging DC-DC driver IC (IC585) and the switching FET (Q580) when power at 11.0 to 15.9 VDC is supplied to the DC-IN JACK. At the same time, the VINOK pin (pin 5 of IC585) will be set to a high level.

When the +B voltage is 5.3 V or higher, the output of the comparator IC (IC591) will be fixed to a low level and the collector voltage of the Q585 will be set to a high level.

When the VINOK pin of the IC585 is set to a high level, the monostable multivibrator IC (IC588) will output a single-pulse signal. When a battery at 5.5 V or higher is connected, the monostable multivibrator IC (IC588) will output a single-pulse signal.

The EN pin (pin 1) of the DC-DC module (IC584) will be set to a high level when the power switch is pressed or when the single-pulse signal is input into the logic circuitry consisting of the OR circuit (IC592), AND IC (IC587), and NOT circuit (Q584).

When the EN pin of the IC584 is set to a high level, the IC584 will output a constant voltage of 4.0 V to the 40C power supply, and the main MPU (IC700) will start.

When the main MPU starts, the main MPU will transmit a charge control instruction to the IC585 and set the 40CS to a high level at the same time.

The EN pin of the IC584 will be kept at a high level as the 40CS is set to a high level. As a result, the IC584 will output 4.0 V to the 40C continuously, and the main MPU will continue to operating.

2.1.6.2 Lithium-ion Battery charging control circuit

The IC585 will charge the lithium battery by receiving the charge control instruction from the main MPU. The IC585 will detect the battery voltage and the battery charging current, and operate as shown below.

If the battery voltage is less than 6.0 V, the IC585 and Q580 will supply a constant voltage of 6.0 V to the +B power supply, and control the gate voltage of the Q581 and perform pre-charging at a charging current of 128 mA.

If the battery voltage is 6.0 V or higher and less than 8.4 V, the Q581 will be turned ON. Then the IC585 and Q580 will perform switching (constant current charging) so that the charging current will be a constant current as specified, and supply a voltage almost the same as the battery voltage to the +B power supply.

When the voltage battery rises to 8.4 V, the Q581 will be kept turned ON, and the IC585 and Q580 will provide the +B power supply with a constant voltage of 8.4 V and perform the constant voltage charging of the battery.

During the constant voltage charging of the battery, the charging current will gradually decrease. The battery will be deemed to be fully charged when the charging current reaches 128 mA or below, and the Q581 will be turned OFF, and the charging will be completed.

If the charging of the battery is completed while the transceiver is in signal reception or a standby state, the IC585 and Q580 will continue providing a constant voltage of 8.4 V to the +B power supply.

If the charging of the battery is completed while the transceiver is in a standby state, the main MPU will send a charge stop instruction to the IC585, and the IC585 will stop charging the battery. The main MPU will set the 40CS to a low level, thus stopping the operation of the IC584 to block the 40C power supply. Then the main MPU will stop operating, and the transceiver will be turned off.

If the transceiver starts transmission while the battery is charged, the main MPU will send a charge stop instruction to the IC585 to stop charging the battery. Upon completion of transmission, the main MPU will transmit a charge control instruction to the IC585 to resume charging the battery.

2.1.6.3 Protection circuit

The main MPU monitors the temperature detected by the thermistor (TH700). If the temperature is out of an optimal temperature range of 0°C to 40°C, the main MPU will transmit a charge stop instruction to the IC585 to stop charging the battery.

The main MPU monitors the DC-IN JACK voltage. If an overvoltage beyond guarantee is applied, the main MPU will stop the operation of the transceiver and protect the circuits.

Fig.8 Power supply circuit (TXRX PCB)

Fig.9 Power supply circuit (CONT PCB)

2.1.7 AF signal system

2.1.7.1 Reception AF circuit

■Demodulation signal circuit

Reception AF signals demodulated by the respective IF ICs (IC281 and IC284) for the A-band and B-band are independently applied to the main MPU/DSP (IC702) through the CODEC IC (IC707). Each signal is de-emphasized under loudness control. Then the signals pass through the CODEC IC (IC707), enter to the AF amplifier (IC880) for the last amplification of the signals, pass through the SP MUTE switches (Q881 and Q883), and drive the SP.

Furthermore, the transceiver can save its power consumption in save mode by turning OFF the AVR (IC882) for the AF amplifier (IC880) according to an AFM control signal from the main MPU (IC702).

■Tone decode circuit

Reception AF signals for the A-band and B-band will be independently applied to the MPU/DSP (IC702) if the CTCSS, DCS, and Weather Alert function are ON, and selected signal components will be amplified to a necessary level for decoding processing.

■BEEP, DTMF circuit

The BEEP and DTMF signals generated from the main MPU/DSP (IC702) are applied to the AF Amplifier (IC880), and the signals pass through the SP MUTE switches (Q881 and Q883) and drive the SP.

When the BEEP and DTMF signals are sent, the AF MUTE switch in the main MPU/DSP (IC702) will cause a MUTE-ON state, and the signals will be sent separately from the reception AF signal.

■Squelch circuit

The amount of noise (SQA and SQB) and the signal strength (SMA and SMB) obtained from the respective IF ICs (IC281 and IC284) are retrieved by the main MPU/DSP (IC702) to control the AF MUTE switch.

■FM tuner circuit

The FM broadcasting band (76MHz~108MHz) signal can be received using an SMA antenna.

The reception signal passes through the band-pass filter and enters the RF amplifier (Q675) for the amplification of the signal, and the signal is applied to the FM tuner IC (IC674). The signal is demodulated in the FM tuner IC to generate an audio signal and de-emphasized. Then the signal is applied to the main MPU/DSP (IC702) for loudness control. Then the signal enters the AF amplifier (IC880) for the last amplification of the signal, passes through the SP MUTE switches (Q881 and Q883), and drives the SP.

Fig.10 Reception AF circuit

2.1.7.2 Transmission AF circuit

■Modulation signal circuit

The transmission AF signal from the microphone is amplified by the MIC amplifier (IC881), applied to the main MPU/DSP (IC702) through the CODEC IC (IC707), and pre-emphasized.

Each signal made in the main MPU/DSP (IC702) is processed as shown below. The TONE and DTMF signals are pre-emphasized here. Packet transmission data at 1200 bps is subjected to the baseband filter and sub-carrier modulation. Packet transmission data at 9600 bps is subjected to the baseband filter only.

The transmission AF signal that has been level adjusted to an appropriate value passes through the CODEC IC (IC707), and then branched into two. One of them is amplified by the MOD VCO AMP (IC720) and applied as a high-speed modulation signal (MOD) to the D/A converter (IC671). Then the signal is applied to the VCO B. The other is amplified by the MOD TCXO AMP (IC720) and applied to the reference oscillator (X362).

■VOX circuit

The transmission AF signal is amplified by the VOX amplifier (IC881) and detected by the DC-detector (D882) to obtain a DC voltage in proportion to the input signal level. This voltage is input into the main MPU/DSP (IC702) to monitor the audio signal level.

Fig.11 Transmission AF circuit

2.1.8 Control system

The control circuit consists of the main MPU/DSP (IC702), its peripheral circuits, and sub MPU (IC661). The IC702 has the following primary roles.

- (1) Switching of transmission and reception by the PTT signal.
- (2) Reading of the system program from the memory.
- (3) Control of the audio mute circuit according to decode data.

The IC661 has the following primary roles.

- (1) Frequency program transfer to the PLL and IF IC control.

2.1.8.1 MAIN MPU

The main microprocessor with digital signal processor (MPU/DSP) (IC702) incorporates a 32-bit RISC processor, fixed- and floating-point VLIW digital signal processors, and peripheral functions.

This microprocessor operates at a 139.2 MHz clock rate and 3.3/1.8/1.2 VDC. The microprocessor controls the transmission and reception of data to and from the flash memory, mobile DDR, control circuit, display circuit, sub MPU, and external devices.

2.1.8.2 Memory Circuit

The memory circuit consists of the main processor (IC702), mobile DDR (IC701), and flash memory (IC705).

The flash memory has a capacity of 256 Mbits, including a transceiver control program and recording data for the MPU. The mobile DDR has a capacity of 512 Mbits. The MPU copies the program from the flash memory to mobile DDR. The MPU uses the mobile DDR as a work area.

2.1.8.3 LCD

The main MPU (IC702) is in direct control of the LCD.

2.1.8.4 Key Detection Circuit

The I/O expansion IC (IC730) is used to detect the keys. The IC730 detects a key pressed, which will be reported to the main MPU (IC702) through the serial line.

2.1.8.5 SUB MPU Circuit

The sub MPU (IC661) consists of an ARM-based 32-bit processor and a 64-kilobyte flash memory. The sub MPU is in control of the IF IC and PLL IC.

2.1.8.6 DSP

The DSP circuit consists of the MPU/DSP (IC702) and a baseband signal. The DSP operates at a 139.2 MHz clock rate, the I/O section operates at 3.3/1.8 V, and the core section operates at 1.2 V.

2.1.8.7 PC Port

The PC Port supports connections to external equipment (PCs) through the USB connector. The PC Port communicates with the main MPU (IC702).

2.1.8.8 SD slot

The SD Port supports micro SD memory cards through the micro SD memory card connector. The SD Port communicates with the main MPU (IC702).

2.1.8.9 Bluetooth/GPS Circuit

The Bluetooth/GPS circuit mainly consists of the Bluetooth/GPS IC (IC935).

The Bluetooth/GPS requires two clocks, one of which is the 19.2 MHz (X930) clock and the other is the slower clock at 32.768 kHz for the UART.

The Bluetooth/GPS IC uses the HCI UART and AI2 UART to communicate with the main MPU. The level shift ICs (IC930, IC936, and IC937) perform the level conversion of digital audio (PCM) at the UART as the interface between the main MPU (IC702) and Bluetooth/GPS IC (IC935).

The two discrete external regulators (IC931 and IC932) provide power at 1.8 V and 3.3 V to the Bluetooth/GPS IC.

Fig.12 Control circuit

2.2 COMPONENTS DESCRIPTION

2.2.1 TX-RX UNIT (XC1-138K-01)

Ref. No.	Use / Function	Operation/Condition/Compatibility
IC1	RF AMP	TX AMP
IC3	APC	AMP
IC281	IF(A-band)	A-band
IC283	1st Mixer	B-band
IC284	IF(B-band)	B-band
IC285	3rd Mixer	B-band
IC286	IF AMP	B-band
IC287	Buffer(A-band)	OP AMP
IC288	Buffer(B-band)	OP AMP
IC361	Divider	Local B-band
IC363	5C AVR	5.3V regulator
IC364	PLL	A-band
IC365	6.6V DCDC	Charge pump
IC576	33BU AVR	3.3V regulator
IC577	33BV AVR	3.3V regulator
IC578	33CB AVR	3.3V regulator
IC579	33RA AVR	3.3V regulator
IC580	33C AVR	3.3V regulator
IC581	33CA AVR	3.3V regulator
IC582	33S AVR	3.3V regulator
IC583	33RB AVR	3.3V regulator
IC584	40C DCDC	4.0V DC/DC
IC585	Battery Charger	8.4V DC/DC Driver IC with Battery Charger
IC586	31BU AVR	3.1V AVR
IC587	AND SW	Power ON Logic for DC IN or Battery Insert
IC588	Pulse Generator	Power ON Logic for DC IN or Battery Insert
IC589	47C AVR	4.7V AVR
IC590	33IF AVR	3.3V AVR
IC591	AMP	Power ON Logic for DC IN or Battery Insert
IC592	OR Circuit	Power ON Logic for DC IN or Battery Insert
IC593	33RAD AVR	3.3V AVR
IC661	Sub MPU	Sub CPU
IC662	AND SW	A-band PLL IC Control Signal
IC663	AND SW	B-band PLL IC/FM IC Control Signal
IC671	DA Converter	Signal level adjust
IC672	Inverter	Oscillation circuit for FM tuner IC
IC673	AND SW	BCLK, WCLK on/off
IC674	FM tuner	FM radio
IC675~677	Gate SW	SDO0, SCK0, /EVCS on/off
IC700	33SD AVR	3.3V AVR

Ref. No.	Use / Function	Operation/Condition/Compatibility
IC701	LPDDR	Program for operation
IC702	Main MPU	CPU with DSP
IC703	Reset	3.5V detect
IC704	/BINT	5.0V detect
IC705	FLASH	Store the program and user data
IC707	CODEC	coder/decoder for IF and AF
IC708	CODEC AVR	1.8V for CODEC
IC709	LED driver	LCD backlight driver
IC710	AND SW	LCD backlight control
IC711	Inverter	Oscillation circuit for CODEC
IC712	33M AVR	3.3V regulator
IC713	30M AVR	3.0V regulator
IC714	33AD AVR	3.3V regulator
IC715	Level shift	Level shift 1.8V -> 3.1V
IC717	31BU AVR	3.1V regulator
IC718	18M DCDC	1.8V DC/DC
IC719	AND SW	VINOK on/off
IC720	MOD AMP	OP AMP
IC721	ADC VREF	2.1V ref for ADC
IC722	12M DCDC	1.2V DC/DC
IC723	12BU AVR	1.2V regulator
IC724	Load SW	18M on/off
IC725	ADC	Signal level converter
IC726,732	Bus SW	Analog signal on/off
IC728	AND SW	PWR on/off
IC730	I/O Expander	Key scan and LCD backlight control
IC731	LAMP B	Variable regulator (6.8V)
IC733	SW	Pull up switch
IC880	AF AMP	SP output
IC881	MIC AMP	OP AMP
IC882	AF AMP AVR	Variable regulator (6.8V)
IC930	Level shift	Level shift 1.8V <=> 3.3V
IC931	18BT AVR	1.8V regulator
IC932	33BT AVR	3.3V regulator
IC933	30GPS AVR	3.0V regulator
IC935	BT and GPS	Bluetooth and GPS control
IC936,937	Level shift	Level shift 1.8V <=> 3.3V
Q1	RF AMP	TX final AMP(220M)
Q2	RF AMP	TX final AMP(VHF/UHF)
Q3	SW	220M TX
Q4	SW	VHF TX
Q5	SW	Band SW(VHF,UHF/220M)
Q6	RF AMP	TX drive AMP
Q7	SW	APC slope change SW
Q8	DC SW	TX on/off

Ref. No.	Use / Function	Operation/Condition/Compatibility
Q9,10	DC SW	47C on/off

2.3.8 Micro USB Socket J700

Pin No.	Pin Name	I/O	Function	Rating and Condition
1	V BUS	I	V BUS sense input	Input voltage 4.4-5.25V
2	DM	I/O	USB D-	Full-Speed(12Mbps) VIH>2.0V,VIL<0.8V Included Pull up resistors
3	DP	I/O	USB D+	Full-Speed(12Mbps) VIH>2.0V,VIL<0.8V
4	NC	-	NC	-
5	GND	I	GND	GND

2.3.9 micro SD Slot J701

Pin No.	Pin Name	I/O	Description	Rating and Condition
1	DAT2	I/O	Data line is bidirectional signal. Host and card drivers operate in push pull mode.	VIH:2.0 to 3.6V VIL:-0.3 to 0.8V VOH($Io=4mA$):2.4 to 3.6V VOL($Io=4mA$):max 0.4V
2	DAT3	I/O	Data line is bidirectional signal. Host and card drivers operate in push pull mode.	VIH:2.0 to 3.6V VIL:-0.3 to 0.8V VOH($Io=4mA$):2.4 to 3.6V VOL($Io=4mA$):max 0.4V
3	CMD	I/O	Command is bidirectional signal. Host and card drivers operate in push pull mode.	VIH:2.0 to 3.6V VIL:-0.3 to 0.8V VOH($Io=4mA$):2.4 to 3.6V VOL($Io=4mA$):max 0.4V
4	VDD	O	3.3V power supply output.	Output Voltage:3.267 to 3.333V(typ3.3V) Maximum Current max 0.2A
5	CLK	I/O	Clock is a host to card signal. CLK operates in push pull mode.	VOH($Io=4mA$):2.4 to 3.6V VOL($Io=4mA$):max 0.4V Clock frequency (High Speed MODE) MAX 50MHz
6	VSS	-	GND	-
7	DAT0	I/O	Data line is bidirectional signal. Host and card drivers operate in push pull mode.	VIH:2.0 to 3.6V VIL:-0.3 to 0.8V VOH($Io=4mA$):2.4 to 3.6V VOL($Io=4mA$):max 0.4V
8	DAT1	I/O	Data line is bidirectional signal. Host and card drivers operate in push pull mode.	VIH:2.0 to 3.6V VIL:-0.3 to 0.8V VOH($Io=4mA$):2.4 to 3.6V VOL($Io=4mA$):max 0.4V
-	Card Detect SW	I	Normally open. microSD is inserted ON. microSD is inserted OFF.	VIH:2.0 to 3.6V VIL:-0.3 to 0.8V
-	COMMON	-	-	-

2.3.10 Microphone Jack J880

Pin No.	Pin Name	I/O	Function	Rating and Condition
1	PTT	I	PTT	VIH:2.0 to 3.6V Standby VIL:-0.3 to 0.4V Transmit
2	33M	O	3.3V output	VOH($Io=7.5mA$ max):2.4 to 3.6V
3	MIC	I	External Microphone input	2k ohm terminated

2.3.11 Speaker Jack J880

Pin No.	Pin Name	I/O	Function	Rating and Condition
6	SPG	I	Speaker GND	GND
7	SP	O	SP AF output	Output impedance 8 ohm or higher. Ex)SMC-34's speaker impedance is 15.5 ohm
8	REM	I	Remote key Detection	PF1:3.9k±5%.PF2:10k±5%.PF3:27k±5%. Lock:less than 10 ohm

2.3.12 DC Jack J576

Pin No.	Pin Name	I/O	Function	Rating and Condition
1	+	I	Voltage Supply	Voltage:11.0-15.9V
2	GND	I	GND	GND

SECTION 3 DISASSEMBLY

3.1 How to Remove the Case Assembly

- (1) Remove the SP/MIC cap <1>.
- (2) Pull out the two knobs <2>.
- (3) Remove the two screws <3> on the front case.
- (4) Remove the nut <4> of the antenna receptacle.
- (5) Remove the nut <5> of the volume/encoder.
- (6) Remove the top panel <6>.
- (7) After removing the flat cable for the KEY PCB from the connector, remove the front case from the chassis.

3.2 How to Remove the PCB

3.2.1 CONTROL PCB (TX-RX 1/7)

- (1) Remove the flexible connector of the LCD <7>. Remove two tabs <8> and two screws <9> on the LCD mounting bracket. Then remove the LCD.
- (2) Remove the 3 screws <10> on the PCB.
- (3) Lift the CONTROL PCB, and disconnect the cord assembly (50-pin) <11>, volume/encoder FPC <12>, and GPS coaxial cable <13> from the respective connectors.
- (4) Remove the CONTROL PCB from the chassis.

3.2.2 TX-RX PCB (TX-RX 2/7)

- (1) Remove the two tabs on the left- and right-hand side of the rear packing <14> from the chassis, and remove the packing from the chassis.
- (2) Remove the solder on the antenna terminal <15>.
- (3) Remove the 11 screws <16> on the PCB.
- (4) Lift and remove the TX-RX PCB.

3.3 Precautions for Disassembly

3.3.1 How to Remove Key Tops

- (1) The key tops are pasted to the surface of the front case with double-sided tape. Push the key tops from the inner side hole of the front case at the time of removing or replacing the key tops.

3.3.2 How to Remove Rear Packing

- (1) Remove the two tabs on the left- and right-hand side on the packing from the slit of the chassis first at the time of removing the rear packing.

3.3.3 Remove the top cover from the shield cover

- (1) Use tweezers to slightly lift the edge of the top cover. <1>
(2) As you do step 2 above, vary the position you hold the top cover as you lift it, and remove the top cover <2>.

Note: Once the top cover is removed, it cannot be used again.

Note:

Push evenly on the top cover and be careful that you do not bend it as you install it on the shield cover.

3.4 Precautions for Reassembly

3.4.1 Mounting of Bluetooth Antenna (BAR SPRING)

- (1) Mount the Bluetooth antenna onto the front-side groove of the case with the absence of the front glass, the state of which will occur at the time of replacing the front case, for example.

- (2) Turn the Bluetooth antenna to the rear side of the case, and mount the antenna onto the rear groove of the case.

3.4.2 Forming of GPS Coaxial Cable

- (1) Perform the forming the GPS coaxial cable as shown in the figure.

3.4.3 Mounting of Top Panel Nuts and Front Case Screws

- (1) Assemble the front case into the chassis and attach the two nuts to the top panel.
(2) Attach the two screws to the front case.

3.4.4 Check on Waterproof Packing of Battery Terminals and micro SD Card Section

- (1) After assembling the TX-RX PCB (TX-RX 2/7) into the chassis, check that the waterproof packing of the battery terminal section is firmly inserted.

- (2) After assembling the front case into the chassis, check that the waterproof packing of the micro SD card section is firmly inserted.

3.4.5 Assembly Information (Sheet/Cushion)

When "Main Parts" is changed (ordered), "Assembled Sheet / Cushion" should also be changed (ordered) together. The Sticker and Sheet etc are non-reusable parts. It requires the new one to get the radio's performance after repairs. For example, when "Mounting bracket (J2B-0201-00)" is changed, "Cushion (G1D-0133-00)" should be ordered and changed together because Cushion (G1D-0133-00) are non-reusable.

Main Parts		Assembled Sheet/ Cushion	
Part Name	Part Number	Part Name	Part Number
Case ASSY (for service) "Case/All-around packing/Speaker/ Speaker lead wire"	XC2-030J-00	Key top	K2K-0186-00
		Front glass	B1A-0052-00
		Sheet (KEY PCB)	G1B-0148-00
		Cushion (MIC)	G1D-0144-00
Mounting bracket(LCD)	J2B-0201-00	Cushion (LCD)	G1D-0133-00

3.4.6 Replacing Service PCB

The following part does not belong to the Control PCB and TX-RX PCB for service. Please use the part which has been attached to the printed circuit board. After the replacement of the printed circuit board, be sure to update the firmware to the latest version, and then be sure to adjust the transceiver over again.

Service PCB	Part Name	Part Number
TX-RX PCB (TX-RX 2/7)	Battery terminal x3	E2K-0031-00
	Packing (Terminal block)	G5D-0076-00
	Terminal block	E7C-0011-00
	Shielding cover (VCO-A)	F1B-0052-00
	Shielding cover (VCO-B)	F1B-0053-00
Control PCB (TX-RX 1/7)	Lithium battery	W09-0971-05

SECTION 4 ADJUSTMENT

4.1 Updating the Firmware

The firmware can be updated using Firmware Updating Program (s).

Update the firmware according to the procedure displayed in updating program.

Download the latest updating program from the following URL:
http://www.kenwood.com/i/products/info/amateur/software_download.html

* The URL may change without notice.

4.2 Required Test Equipment

(1) Stabilized Power Supply

- a) The supply voltage can be changed between 3V and 16V and the current is 3A or more.
- b) The standard voltage is 13.8V.

(2) DC Ammeter (DC. A.)

- a) Class 1 ammeter (17 ranges and other features)
- b) The full scale can be switched between 300mA and 3A.
- c) A cable with low internal loss must be used.

(3) Frequency Counter (f. counter)

- a) Frequencies of up to 1GHz or so can be measured.
- b) The sensitivity can be changed to 250MHz or below and measurements are highly stable and accurate (about 0.2ppm).

(4) Power Meter (terminal type)

- a) Measurable frequency: Up to 500MHz
- b) Impedance: 50 ohm, unbalanced
- c) Measuring range: Full scale of 10W
- d) The specified special connection cable must be used.

(5) RF Voltmeter (RF VM)

- a) Measurable frequency: Up to 500MHz or so

(6) Linear Detector

- a) Measurable frequency: Up to 500MHz
- b) Characteristic is flat and CN is 60dB or more.

(7) Digital Voltmeter (DVM)

- a) Voltage range: FS = 18V or so
- b) Input resistance: 1M ohm or more

(8) Oscilloscope

- a) Measuring range: DC to 30MHz
- b) Provides highly accurate measurements for 5 to 25MHz

(9) AF Voltmeter (AF VM)

- a) Measurable frequency: 50Hz to 1MHz
- b) Maximum sensitivity: 1mV or more

(10) Spectrum Analyzer

- a) Measuring range: DC to 1GHz or more

(11) Standard Signal Generator (SSG)

- a) Maximum frequency: 500MHz or more
- b) Output: -133dBm (0.05μV) to -13dBm (50mV)
- c) Output impedance: 50 ohm

(12) Tracking Generator

- a) Center frequency: 50kHz to 200MHz
- b) Frequency deviation: ±35MHz
- c) Output voltage: 100mV or more

(13) Dummy Load

- a) 8 ohm, 3W or more

4.3 Service Jig

■Battery Jig (W3F-0208-00)

Connect the power cable properly between the battery jig installed in the transceiver and the power supply, and be sure output voltage and the power supply polarity prior to switching the power supply ON, otherwise over voltage and reverse connection may damage the transceiver, or the power supply or both.

Note:

When using the battery jig, you must measure the voltage at the terminals of the battery jig. Otherwise, a slight voltage drop may occur within the power cable, between the power supply and the battery jig, especially while the transceiver transmits.

■Connection cable

Connection cable consists of 2 pieces of flat cable assembly (X42-3510-10), to extend its cable length double for connection between two PCBs.

For repair and adjustment, use this connection cable to connect a Control PCB and a TX-RX PCB by inserting the connection cable to connectors on these PCBs.

Note:

If Control PCB and TX-RX PCB are disassembled from the main chassis, there may possibly cause short-circuit, electrical shock or the high-frequency signal interference.

To verify the transmit state, be sure to keep Control PCB and TX-RX PCB assembled in a chassis.

Besides, transmission without a heat sink attached may possibly cause the device to be damaged.

Be sure to verify the transmit performance with LOW/EL transmit power transmitted in a short amount of time.

4.4 Adjustment Mode

■Outline

- (1) Set the transceiver to adjustment mode and change each setting data item.
- (2) This mode is used when the PCBs are replaced at a service center or at the time of making transceiver readjustments.

Note:

All adjustment data is stored in the flash memory (TX-RX 1/7: CONTROL IC705).

■Operation procedures in adjustment mode

- (1) Turn ON the transceiver.
- (2) Short-circuit two lands (SET and GND) on the component side of the TX-RX unit (1/7) to set the transceiver to adjustment mode.

When the transceiver is set to adjustment mode, the adjustment items for the battery will be displayed.

■LCD display in the adjustment mode

■Key operation in the adjustment mode

Key name	Function	
	>" appears for minor items (Adjustment item change mode).	">" appears for "Temporary" (Adjustment value change/Setting mode)
Encoder, [▲], [▼]	Adjustment item change	Adjustment value change
[◀]	-	Goes to adjustment item change mode
[▶], [ENT], [Write] ([A/B])	Set to adjustment value change/adjustment mode, and ">" moves to "Temporary."	Adjustment value change
[Auto] ([MODE])	-	Start of automatic adjustment (BPF calibration adjustment)*1

Note:

- Transmission power adjustments are possible with the [▶], [ENT] or [Write] key only during transmission.
- The backlight will not be lit while in adjustment mode so as to prevent the adverse influence of the backlight current on the adjustment.

*1

(1) The BPF automatic adjustment will start when the [Auto] key is pressed.

The adjustment value will be set when the automatic adjustment is finished successfully.

"Adjust NG" will appear if the automatic adjustment fails.

(2) Calibration is adjusted with the [Auto] key.

■Adjustment items and Display

4.5 Adjustment Points

■TX-RX UNIT (2/7) Component side

CV_A: VCO lock voltage (A-band)

CV_B: VCO lock voltage (B-band)

* Check the VCO lock voltage with the VCO shield case attached.

4.6 Common Section

Item	Condition	Measurement			Adjustment			Specifications /Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1.VCO Lock Voltage Check A-Band	Battery terminal:7.4V 1) Frequency: 216.000MHz	DVM	TX-RX (2/7)	CV_A			Check	0.5V or more
	2) Frequency: 173.995MHz	DVM	TX-RX (2/7)	CV_A			Check	4.9V or less
B-Band	VCO1 3) Frequency: 266.945MHz	DVM	TX-RX (2/7)	CV_B			Check	4.9V or less
	VCO1 4) Frequency: 176.950MHz	DVM	TX-RX (2/7)	CV_B			Check	0.5V or more
	VCO2 5) Frequency: 176.945MHz	DVM	TX-RX (2/7)	CV_B			Check	4.9V or less
	VCO2 6) Frequency: 266.950MHz	DVM	TX-RX (2/7)	CV_B			Check	0.5V or more

Item	Condition	Measurement			Adjustment			Specifications /Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
2.Battery Voltage Adjust	Goes to adjustment mode. See "4.4 Adjustment Mode". 1) Battery terminal: 7.4V	DVM		Battery terminal			[▶] or [Write]	Note: The correct transmission power will not be output from the transceiver in user mode unless the battery voltage is adjusted correctly.

4.7 Transmitter Section: Adjustment Mode Setting Items

Item	Condition	Measurement			Adjustment			Specifications /Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. Frequency (TCXO Shift OFF)	Battery terminal:7.4V/3.0A 1) Frequency:439.900MHz Transmission	f. counter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	439.9MHz ±50Hz
(TCXO Shift ON)	2) Frequency:439.900MHz Transmission	f. counter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	439.9MHz ±50Hz
2. Power	Battery terminal:7.4V/3.0A 1) Power:HI Frequency:146.100MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	4.8W ±0.1W 2.18A or less
	2) Power:HI Frequency:144.100MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	4.8W ±0.1W 2.18A or less
	3) Power:HI Frequency:147.900MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	4.8W ±0.1W 2.18A or less
	4) Power:Mid Frequency:146.100MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	2.0W ±0.1W 1.55A or less
	5) Power:Mid Frequency:144.100MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	2.0W ±0.1W 1.55A or less
	6) Power:Mid Frequency:147.900MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	2.0W ±0.1W 1.55A or less
	7) Power:Low Frequency:146.100MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	0.5W ±0.05W 0.90A or less
	8) Power:Low Frequency:144.100MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	0.5W ±0.05W 0.90A or less
	9) Power:Low Frequency:147.900MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	0.5W ±0.05W 0.90A or less
	10) Power:EL Frequency:146.100MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	50mW~100mW 0.55A or less
	11) Power:EL Frequency:144.100MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	50mW~100mW 0.55A or less
	12) Power:EL Frequency:147.900MHz Transmission	Power meter Ammeter		ANT		Encoder [▲]/[▼]	[▶] or [Write]	50mW~100mW 0.55A or less

	12) SSG: OFF	SSG Oscilloscope		ANT			Check	Close Squelch
	13)Frequency: 51.100MHz SQL :Level1 Mode:FM(3kHz) SSG: -118dBm(0.28μV)	SSG Oscilloscope		ANT			Check	Open Squelch
	14) SSG: OFF	SSG Oscilloscope		ANT			Check	Close Squelch

Item	Condition	Measurement			Adjustment			Specifications /Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
4.S-meter A-Band	1)Frequency: 145.950MHz Mode:FM(3kHz) SSG: -120dBm(0.22μV)±5dB	SSG		ANT			Check	One segment in S-meter lights.
	2)SSG: -105dBm(1.26μV)±5dB	SSG		ANT			Check	All segments in S-meter light.
	3)Frequency: 223.550MHz Mode:FM(3kHz) SSG: -120dBm(0.22μV)±5dB	SSG		ANT			Check	One segment in S-meter lights.
	4)SSG: -105dBm(1.26μV)±5dB	SSG		ANT			Check	All segments in S-meter light.
	5)Frequency: 439.950MHz Mode:FM(3kHz) SSG: -120dBm(0.22μV)±5dB	SSG		ANT			Check	One segment in S-meter lights.
	6)SSG: -105dBm(1.26μV)±5dB	SSG		ANT			Check	All segments in S-meter light.
B-Band	7)Frequency: 145.950MHz Mode:FM(3kHz) SSG: -120dBm(0.22μV)±5dB	SSG		ANT			Check	One segment in S-meter lights.
	8)SSG: -105dBm(1.26μV)±5dB	SSG		ANT			Check	All segments in S-meter light.
	9)Frequency: 223.550MHz Mode:FM(3kHz) SSG: -117dBm(0.32μV)±5dB	SSG		ANT			Check	One segment in S-meter lights.
	10)SSG: -102dBm (1.77μV)±5dB	SSG		ANT			Check	All segments in S-meter light.
	11)Frequency: 439.950MHz Mode:FM(3kHz) SSG: -120dBm(0.22μV)±5dB	SSG		ANT			Check	One segment in S-meter lights.
	12)SSG: -105dBm(1.26μV)±5dB	SSG		ANT			Check	All segments in S-meter light.
	13)Frequency: 51.100MHz Mode:FM(3kHz) SSG: -116dBm(0.35μV)±5dB	SSG		ANT			Check	One segment in S-meter lights.
	14)SSG: -101dBm(2μV)±5dB	SSG		ANT			Check	All segments in S-meter light.
5.AF distortion A-Band	1)Frequency: 145.950MHz Mode:FM(3kHz) SSG: -53dBm(501μV) AF output: 0.63V/8 ohm	SSG Audio analyzer Oscilloscope		ANT SP			Check	5% or less
B-Band	2)Frequency: 439.950MHz Mode:FM(3kHz) SSG: -53dBm(60dBμ)(501μV) AF output: 0.63V/8 ohm	SSG Audio analyzer Oscilloscope		ANT SP			Check	5% or less
6.Standby Current	1) Set the transceiver to the single band. ([F]+[A/B]) 2) Close the squelch.	Ammeter		Battery terminal			Check	150mA or less
7.Built-in Bar Antenna	1)Receive the AM broadcast between 1000 and 1600 kHz.			BarANT			Check	Check that AM broadcast is received.

SECTION 5 TROUBLESHOOTING

5.1 Fault Diagnosis of the BGA (Ball Grid Array) IC

■Overview

A flowchart for determining whether or not the transceiver can be powered on (the LCD does not function even if the power switch is turned on) due to broken BGA parts.

■BGA parts

MAIN MPU(IC702), mobile DDR(IC701), Flash Memory(IC705)

■Descriptions of signal names

- | | | |
|---------------------|---------------------------------------|---------------------|
| (1) /RST | :MAIN MPU reset signal | LOW → Reset |
| (2) /BINT | :Battery final voltage monitoring | LOW → Final voltage |
| (3) /FRST | :Flash Memory reset signal | LOW → Reset |
| (4) /CS_F | :Flash Memory chip select signal | LOW → Active |
| (5) 30M | :LCD module control 3.0V power supply | |
| (6) /RESET(LCD_RST) | :LCD reset signal | LOW → Reset |
| (7) /CS4 | :LCD controller chip select signal | LOW → Active |

5.2 Failure diagnosis of the Bluetooth section

Overview:

When the Bluetooth function does not operate, use this flowchart to determine the problem.

Major parts for a Bluetooth circuit

- Bluetooth antenna
- LC filter (FL932)
- Bluetooth/GPS IC (IC935)
- Level converter (IC936)
- Level converter (IC937)
- TCXO 19.2MHz (X930)
- 32.768kHz clock (X931)
- 33BT Regulator (IC932)
- 18BT Regulator (IC931)
- MAIN MPU (IC702)

Descriptions of signal names

- (1) 33BT:BT/GPS IC 3.3V power supply
- (2) 18BT:BT/GPS IC 1.8V power supply
- (3) TXD2:BT/GPS serial data line (UART)(IC702(MAIN MPU) → IC936(LEVEL CONVERTER))
- (4) RXD2:BT/GPS serial data line (UART)(IC936(LEVEL CONVERTER) → IC702(MAIN MPU))
- (5) 18BT_HCI_RX:Serial data line (UART)(IC936(LEVEL CONVERTER) → IC935(BT/GPS IC))
- (6) 18BT_HCI_TX:Serial data line (UART)(IC935(BT/GPS IC) → IC936(LEVEL CONVERTER))
- (7) /BT_SHUTDOWN:BT active control (IC702(MAIN MPU) → IC935(BT/GPS IC)) High Active, Low Reset

5.3 Failure diagnosis of the GPS section

Overview:

When the GPS function does not operate, use this flowchart to determine the problem.

Major parts for a GPS circuit

- GPS Connector(CN931)
- SAW Filter(FL931)
- Bluetooth/GPS IC (IC935)
- Level Converter IC (IC930)
- TCXO 19.2MHz (X930)
- 32.768kHz clock (X931)
- 33BT Regulator (IC932)
- 18BT Regulator (IC931)
- 30GPS Regulator (IC933)
- MAIN MPU (IC702)
- GPS module (T9A-0037-00)

Descriptions of signal names

- (1) 33BT: BT/GPS IC 3.3V power supply
- (2) 18BT: BT/GPS IC 1.8V power supply
- (3) TXD1: BT/GPS serial data line (UART)(IC702(MAIN MPU) → IC930(LEVEL CONVERTER))
- (4) RXD1: BT/GPS serial data line (UART)(IC930(LEVEL CONVERTER) → IC702(MAIN MPU))
- (5) 18GPS_RX: Serial data line (UART)(IC930(LEVEL CONVERTER) → IC935(BT/GPS IC))
- (6) 18GPS_TX: Serial data line (UART)(IC935(BT/GPS IC) → IC930(LEVEL CONVERTER))
- (7) /GPS_SHUTDOWN: GPS active control (IC702(MAIN MPU) → IC935(BT/GPS IC)) High Active, Low Reset

LEVEL DIAGRAM

■ Receiver Section

Note1: The RF levels at each point, were measured with a spectrum analyzer through a 0.1uF capacitor.

Note2: The IF level were measured with 145.95 MHz of RX frequency.

Note3: The AF levels were measured with an oscilloscope when 145.95MHz of RX frequency, -60dBm standard signal generator signal modulated by a 1kHz modulation frequency and a 3kHz deviation was input and the AF output was adjusted to 0.63V/8 Ohm by the AF VR.

■ Transmitter Section

Note1: This is the value measured while removed from the chassis. Use a short transmission burst. In the worst case scenario, some parts will be damaged.

During this test, some parts will reach high temperature.

Note2: For the 1kHz MOD to become 8mVrms, set the MIC input terminal to AG.

Note3: Set the transmission output to Low.

Note4: Connect a 500Ω terminal load or power meter to the ANT terminal.

Note5: RF levels for each point, other than for the ANT terminal, are measured at 1000pF with a spectrum analyzer through a capacitor.

Note6: Measure the AF level and Data level values with an oscilloscope.

MEMO

PARTS LIST

[TH-D74A]

* SAFETY PRECAUTION

Parts identified by the Δ symbol are critical for safety. Replace only with specified part numbers.

* BEWARE OF BOGUS PARTS

Parts that do not meet specifications may cause trouble in regard to safety and performance. We recommend that genuine parts be used.

* (x_) in a description column shows the number of the used part.
